## New ZeroMQ functionality in MISP

CIRCL Computer Incident Response Center Luxembourg Team CIRCL - TLP:WHITE

July 2, 2015

# ZeroMQ?

- ZMQ is a high-performance asynchronous messaging library, aimed at use in scalable distributed or concurrent applications.
- CIRCL already uses ZMQ at various places:
  - $\circ\,$  AIL Analysis Information Leak Framework^1 is based on ZMQ.
  - $\circ~IntelMQ^2$  connectors rely on ZMQ too.
  - $\circ~$  Datafeed exchange (Leak, malicious IP addresses,... ).
- MISP used a push-pull model. The new ZMQ extension allow to have a pub-sub<sup>3</sup> model on a message bus.

## MISP ZMQ publish-subscribe

- First version implemented<sup>4</sup> and focus on the global events published.
- At each new publish, MISP pushes the event in JSON format into a Redis list.
- Then a Python-based service is dequeuing the Redis list and does the pub-sub.
- The pub-sub feed is limited to the administrator of the instance (TCP-based).
- External services subscribe to the feed to get all new or updated events from a MISP instance.

<sup>&</sup>lt;sup>4</sup>https://github.com/MISP/MISP/commit/ 3f215743f0cae97587d01d460c222d1c84765c18

#### Future of pub-sub in MISP

- Integration with real-time and alert searches in SIEM (e.g. Splunk) or log analysis tools.
- Having a historical or audit view of MISP events (new, updated and published).
- Extending to other pub-sub systems like Apache Kafka to integrate with other systems.
- Improving the pub-sub distribution with dedicated channel per community.

#### **MISP** flows
